

Amendments to the Claims

Claims 1 - 5 (withdrawn from consideration)

6.. (Presently Amended) A blade material cutting device which is employed for cutting a strip blade material, ~~wherein~~ said device ~~has~~ having:

a stationary blade part having a support face on which a strip plate part and a blade edge part of ~~said the~~ the blade material where ~~said the~~ the blade edge part is formed in an edge of ~~said the~~ the strip plate part are to be overlaid;

A4 a pair of front and rear stationary edges which are disposed in said support face, and which are positioned to be separated from each other by a gap in a direction of feeding ~~said of the~~ the blade material;

a front movable blade part which is movable in front of said support face in lateral directions of said support face, and a rear movable blade part which is movable in the rear of said support face in the lateral directions of said support face;

a movable edge which is disposed in said front movable blade part, and which cooperates with said front stationary edge of said support face to cut ~~said the~~ the blade material; and

a movable edge which is disposed in said rear movable blade part, and which cooperates with said rear stationary edge of said support face to cut ~~said the~~ the blade material.

7. (Presently Amended) A blade material cutting device according to claim 6, wherein each of ~~said the~~ the stationary edges of the support face and ~~said the~~ the movable edges of ~~said~~

the front and rear movable blade parts is are a straight - edge - cutting edge for linearly forming a cut line which extends over ~~said~~ the blade edge part and ~~said~~ the strip blade part of ~~said~~ the blade material after the cutting.

8. (Presently Amended) A blade material cutting device according to claim 6, wherein each of ~~said~~ the stationary edges of the support face and ~~said~~ the movable edges of ~~said~~ the front and rear movable blade parts is are a miter edge - cutting edge for conducting a cutting operation so that ~~said~~ the blade edge part of ~~said~~ the blade material after the cutting has a miter shape.

A4
Claim 9 (cancel)

Claim 10 (withdrawn from consideration)

11. (New) A blade material cutting device which is employed for cutting a strip blade material, said device having:

a stationary blade part having a support face on which a strip plate part and a blade edge part of the blade material where the blade edge part is formed in an edge of the strip plate part are to be overlaid;

a pair of front and rear stationary edges which are disposed in said support face, and which are positioned to be separated from each other by a gap in a direction of feeding of the blade material;

a front movable blade part which is movable in front of said support face in lateral directions of said support face, and a rear movable blade part which is movable in the rear of said support face in the lateral directions of said support face;

a movable edge which is disposed in said front movable blade part, and

which cooperates with said front stationary edge of said support face to cut the blade material;
and

a movable edge which is disposed in said rear movable blade part, and
which cooperates with said rear stationary edge of said support face to cut the blade material;
wherein:

A4
said support face is formed in each of right and left side faces of said
stationary blade part, said pair of front and rear stationary edges which are disposed in said
support face on one side are straight - cutting edges for linearly forming a cut line which extends
over the blade edge part and the strip blade part of the blade material after the cutting, said pair of
front and rear stationary edges which are disposed in said support face on another side are miter-
cutting edges for conducting a cutting operation so that the blade edge part of the blade material
after the cutting has a miter shape'

a pair of right and left movable edges are disposed in said front movable
blade part, with said movable edge on the one side is an edge which cooperates with said straight
- cutting front stationary edge to cut the blade material, and with said movable edge on the other
side is an edge which cooperates with said miter - cutting front stationary edge to cut the blade
material; and

a pair of right and left movable edges are disposed in said rear movable
blade part, with the movable edge on the one side is an edge which cooperates with said straight -
cutting rear stationary edge to cut the blade material, and with the movable edge on the other side
is an edge which cooperates with said miter - cutting rear stationary edge to cut the blade
material.
